DETAILED ACTION

Claim Rejections - 35 USC § 112

- The following is a quotation of the second paragraph of 35 U.S.C. 112:
 The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 2. Claim 7 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The limitation "the secrecy data in the card comprises a random primary secrecy key and a predefined second secrecy key of invariable" does not point out the nature of the keys and for what purpose they are stored on the card.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Richards (GB 2295 939 A) in view of Mueller-Schloer (U.S. patent No. 4.438.824).
- 5. Referring to the instant claims Richards discloses a data communication system (see Fig.3). Richards teaches the use of the cards produced having eye-readable data including a personal name, address and telephone number. In addition, machine-readable data, conveyed via a magnetic strip or similar is also provided on the card. A

Application/Control Number: 09/849,231

Art Unit: 2132

plurality of the cards are supplied to the named individual for distribution to recipients and each recipient is encouraged to apply the card to a card reader (42) arranged to read the machine-readable data from the card. The data read from the card is processed and as a result of this processing, a modem (46) sets up a call to a processing center (47) via a telephone network (48). In response to contacting the database, the database responds by supplying data back to the recipient's processing device (45) relating to the individual named on the card (see abstract and Fig. 3).

- 6. Referring to the independent claim 1 and 6, the limitation "network data processing center that can be connected with a card reader via network" is met by processing center (47) connected to a card reader (42) over computer network (see Fig.3). The limitation "database that supports searches of the network data processing center" is met by a database (see block 73 in Fig.5). The limitation "means for receiving data uploaded from at least one card " is met by a computer (45 in Fig. 3). The limitation "checking whether the uploaded identification data of the card is correct... refusing any login requests if uploaded identification data is not correct" is met by blocks 74, 75 and 82-84 (Fig.5). Richards, however, does not explicitly teach checking the address corresponding to the card reader prior to allowing the card to be logged in.
- 7. Referring to the instant claims, Mueller-Schloer discloses a method for identity verification (see abstract). Mueller-Schloer teaches an apparatus for identity verification using a data card contains at least one terminal and a security service station. The terminal(s) and the station are connected to each other via a communication system.

 The terminal is provided with a central processing unit including a memory, a card

Art Unit: 2132

reader for reading data from the data card, a sensor or number input device for introducing personal identification information, and a crypto module. The crypto module encrypts and decrypts data received from the memory under the control of the central processing unit. The security service station likewise also contains a central processing unit including a memory, and a crypto module. This station also contains a comparator for comparing personal identification information with reference personal identification information (see abstract and Fig.5). According to Mueller-Schloer the validation process is started by inserting the personal data card 2 into the card reader 16 and by activating the sensor of the feature extractor 18. Instead of a personal feature, also a personal identification number may be entered into the terminal 4A. The card reader 16 will read the PDC information, and the feature extractor 18 will extract personal feature(s) from the card user 10 (see Fig.5). Mueller-Schloer shows that the user is authenticated by comparing (in unit 38) the features with the reference features (see Fig. 6A). The features include user IDs and the card reader address. Therefore, at the time the invention was made, it would have been obvious to one of ordinary skill in the art to modify the communication system comprising the card reader connected to the data processing center of Richards by adding the means for checking the addresses of the card readers prior to allowing the logins. One of ordinary skill in the art would have been motivated to modify the communication system comprising the card reader connected to the data processing center by adding the means for checking the addresses of the card readers prior to allowing the logins for identifying the user (see Mueller-Schloer, abstract).

8. Referring to claim 3, Richards teaches uploading the data from the card as soon

as being inserted (see Figs. 4 and 5).

9. Referring to claims 4,5 and 8, Richards teaches a time login status check (see

block 82 in Fig. 5) for maintaining the validity of login.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Grigory Gurshman whose telephone number is (703)

306-2900. The examiner can normally be reached on 9 AM-5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Gilberto Barron can be reached on (703) 305-1830. The fax phone number

for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free).
